

Use your Flex Widget

Now you can use our widget in the Flex View.

- 1) Add a Card and fill the **Flex Widget** field with: myModule:MyFlexWidget

All the properties defined in **MyFlexWidget.fwProps** will be displayed.

A relative ORD can be defined in **Component Ord** field, because we give a base at the resolution in the code ('slot:' to target the component on which the view is agent).

2) The Card is displayed on the selected Page :

The screenshot shows a software interface with a card titled "My Card". At the top right of the card are four icons: a pencil, a magnifying glass, a thumbs up, and a plus sign. Below the title, the text "Component Info:" is displayed. A list of five items follows:

- Name: MyComponent
- Type: control:NumericWritable
- Handle: 931b
- Nav ORD: local:station:slot:/MyComponent
- Permissions: rwiRWI
