

FilterArtifact

Summary

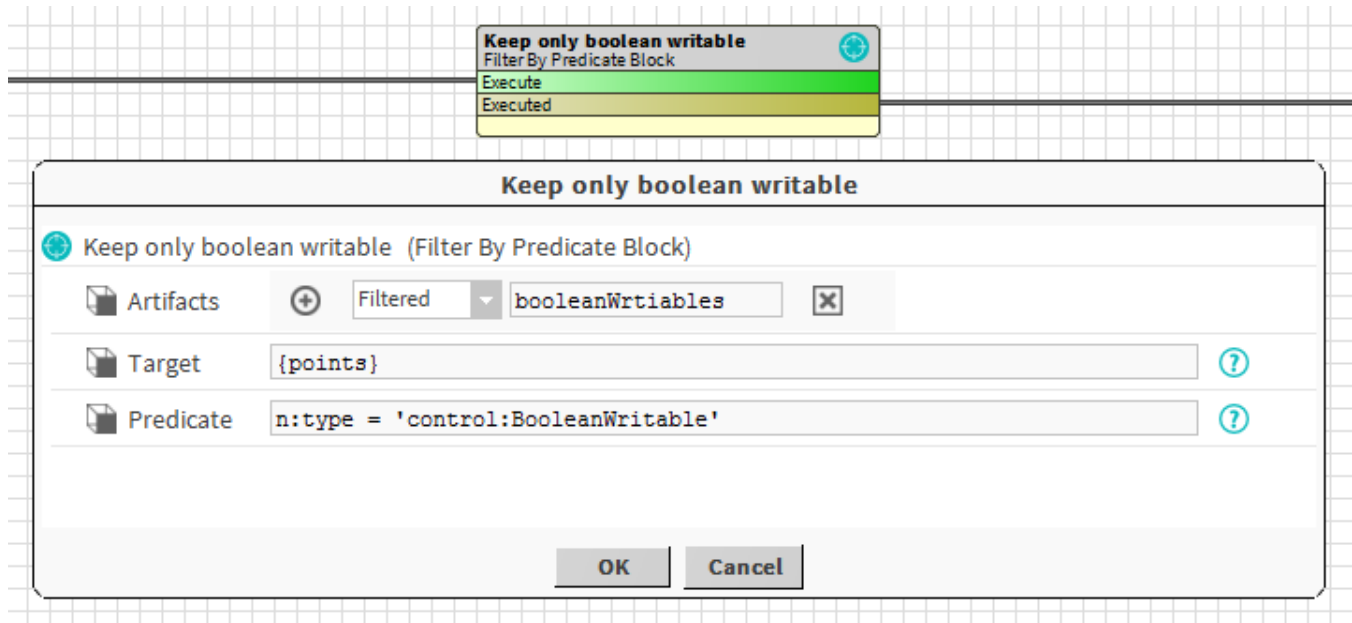

This block is used to filter the elements of an artifact based on a predicate. The filtered artifact will then be used in the following blocks.

Implementation

- Drag and drop the block from the palette
- Link the "execute" action from the "executed" topic of the previous block

Example

This block is based on a previous artifacts that retrieved some points. It will filter the predicate entities to keep only the ones of BooleanWritable type.

Properties

- *Artifacts*: Artifacts created by this block. Be careful, the artifact is an array, you will need sometimes to use .first in a SFormat to use it.
- *Target*: [SFormat](#) to define the target (queries, ord, artifacts etc.)
- *Predicate*: The predicate to match.

Behavior: DO & UNDO

An artifact will be created.
